Behind NLAST <sup>2</sup>	0  o 1 : Techniques crafted from scratch in my acedemic project : NLAST 2022.02 –
	Managed to realize tree-print feature in CMD lines without knowing any tree-packages  in order to visualize run-time Call Stack with buried checkpoints & display crucial info  to understand the hierarchical structure of my code from a more abstract perspective  Enabled CPU multi-threads to accelerate for loops in python while preserving the loops' order  Implemented through utilizing the producer-consumer model (producer = thread pool)  Allow users to select which parts of the codes in the for loops to parallelize in CPU  Transform multi-layer for loops into nested multi-threads: each thread = a new thread pool  Adaptive vertical iters & horizontal sums: ensuring the optimal speed-accuracy  Future model will move away from python as the primary language & shift to GPU  Favoring GPU is driven by "fields in physics = arrays/matrices in math/programs"  Haven't decided which to employ: CUDA, Jax, webGL2, webGPU, Mojo or Bend?  Decided to try some existing packages developed by flatiron institute  Developed a log file system to track & record the operating status for debugging  to output script parameters (**kwargs) for rapid reproducibility of data in the future  to store data files & folders, and their metadata for swift data import and reutilization  Achieved automatic skipping of functions that return repeated values stored in memory  via @decorators: let precomputation assess whether to execute the decorated function  Wrap matplotlib into plot_1d(, _2d, _3d, .gif) for data visualization
	→ also sped up by customized multi-threading Matlab   Mathematica   JavaScript   Python •
