Vector Nonlinear Fourier Crystal Optics

Solving
$$[(\nabla \times)^2 - k_0^2 \bar{\bar{\epsilon}} \cdot] \underline{E(r)} = k_0^2 \bar{\bar{\chi}} : \mathcal{F}_{\omega}^{-1} [\tilde{E}_{p} \tilde{E}_{p}] (r)$$

Behind NLAST ²	 0 → 1 : Techniques crafted from scratch in my acedemic project : NLAST Managed to realize tree-print feature in CMD lines without knowing any tree-packages in order to visualize run-time Call Stack with buried checkpoints & display crucial info to understand the hierarchical structure of my code from a more abstract perspective Enabled CPU multi-threads to accelerate for loops in python while preserving the loops' order Implemented through utilizing the producer-consumer model (producer = thread pool) Allow users to select which parts of the codes in the for loops to parallelize in CPU Transform multi-layer for loops into nested multi-threads: each thread = a new thread pool Adaptive vertical iters & horizontal sums: ensuring the optimal speed-accuracy Future model will move away from python as the primary language & shift to GPU Favoring GPU is driven by "fields in physics = arrays/matrices in math/programs" Haven't decided which to employ: CUDA, Jax, webGL2, webGPU, Mojo or Bend? Decided to try some existing packages developed by flatiron institute Developed a log file system to track & record the operating status for debugging to output script parameters (**kwargs) for rapid reproducibility of data in the future to store data files & folders, and their metadata for swift data import and reutilization 	
	Achieved automatic skipping of functions that return repeated values stored in memory via @decorators: let precomputation assess whether to execute the decorated function Wrap matplotlib into plot_1d(, _2d, _3d, .gif) for data visualization also sped up by customized multi-threading Matlab Mathematica JavaScript	Python 🗘
